Sugarcane, Saccharum officinarum, is a perennial grass in the family Poaceae grown for its stem (cane) which is primarily used to produce sucrose. Sugarcane has a thick, tillering stem which is clearly divided into nodes and internodes. The leaves of the plant grow from the nodes of the stem, arranged in two rows on either side of the stem.
Sugar Crop diseases Syed Zahid Hasan. 2. Red rot of sugarcane CO: Colletotrichum falcatum Red rot is one of the oldest known diseases of sugarcane. It occurs in most cane-growing countries. The sugarcane plant is subject to many diseases. Sereh, a blackening and degeneration of the fanlike tops, is caused by an East Indian virus. Mosaic, which causes mottling or spotting of foliage and sometimes curling, dwarving, and narrowing of the leaves, is due to infection by any of several viruses. Red rot (important in Indonesia and South Asia) is characterized by interrupted red and white patches within the cane along with a sour alcoholic odour when the cane is split open.

**Sugarcane - Diseases | Britannica**
Sugarcane smut is disseminated via teliospores that are produced in the smut whip. These teliospores located either in the soil or on the plant, germinate in the presence of water. The primary transmission of the disease is through diseased seed pieces, while the secondary
transmission is through windblown spores.
